

Biomarkers in ILDs

Are they useful ?

Bruno Crestani

Hôpital Bichat,
Université Paris Diderot, Paris, France

Conflicts of interest

Research	Consultancy

MedImmune	Stallergenes

Definition of a biomarker

- “A characteristic that is objectively measured and evaluated as an indicator of normal biologic processes, pathogenic processes, or pharmacologic responses to a therapeutic intervention”

Are Biomarkers of interest in ILDs ?

- 1. Diagnosis**
- 2. Prognosis : predict disease progression**
- 3. Treatment tailoring**
- 4. A better understanding of pathophysiology**

Are Biomarkers of interest in ILDs ?

- **Diagnosis**

- Idiopathic/non idiopathic

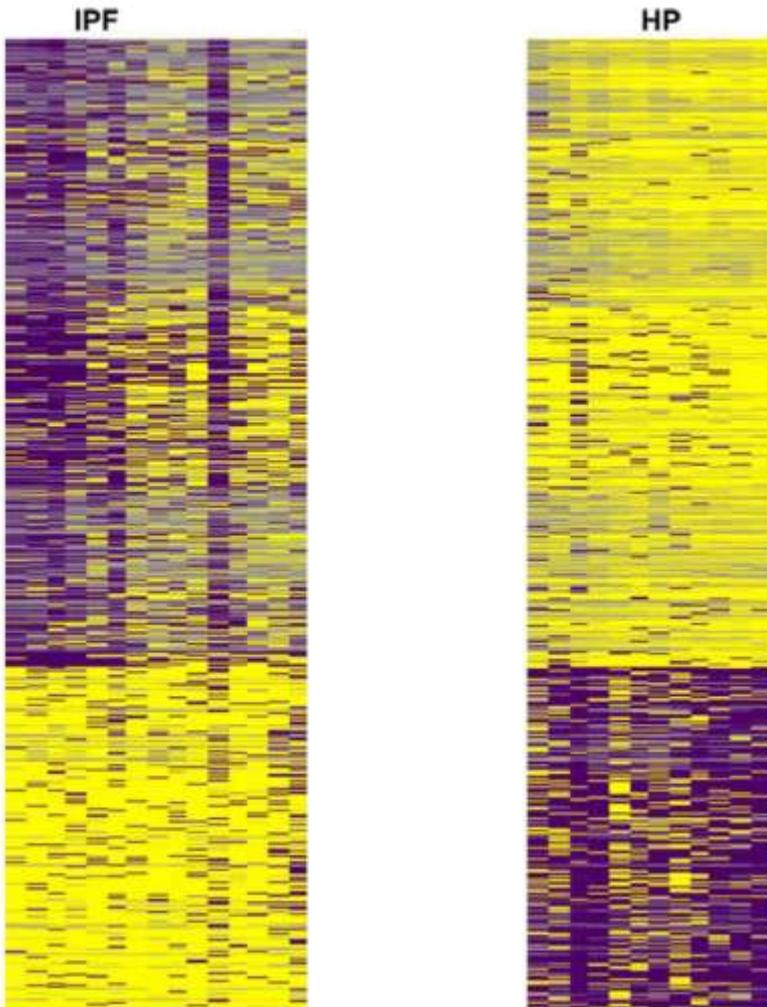

- e.g. IPF vs Chronic HP

(≠ precipitins : marker of exposure)

- Identify pathological patterns : e.g. NSIP/UIP

- Avoid surgical lung biopsy in Possible UIP/Probable NSIP

Lung transcriptome- to differentiate IIPs/nonIIPs

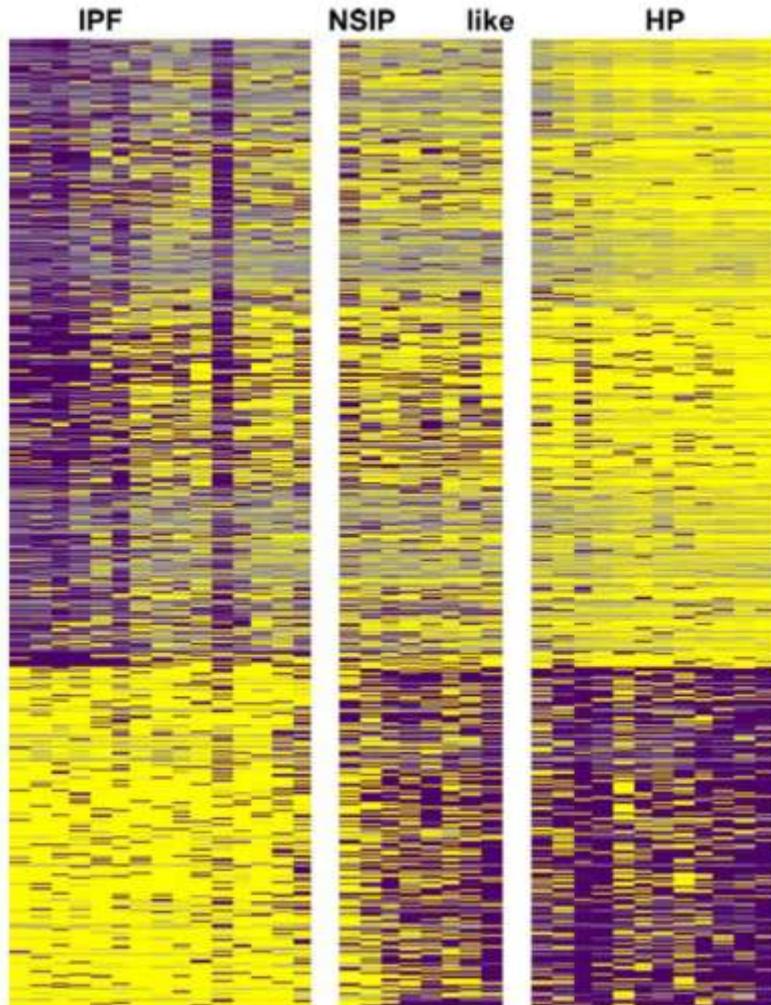

IPF

Tissue remodeling, epithelial, and myofibroblast genes.

HP gene expression signature

inflammation, T-cell activation, and immune responses.

Lung transcriptome- to differentiate IIPs/nonIIPs UIP/NSIP

Selman, AJRCCM 2006

IPF

Tissue remodeling, epithelial, and myofibroblast genes.

HP gene expression signature

inflammation, T-cell activation, and immune responses,

NSIP

Two cases : IPF-like gene expression,

One : HP like

Others : specific pattern

Unresolved controversy :

- Yang et al. found slight minimal differences between UIP/NSIP pattern

Yang, AJRCCM 2007

**Lung transcriptome, miRNome,
proteome**

=

Proof of concept

**More readily available material
Blood, Exhaled Air, Urine...**

Plasma

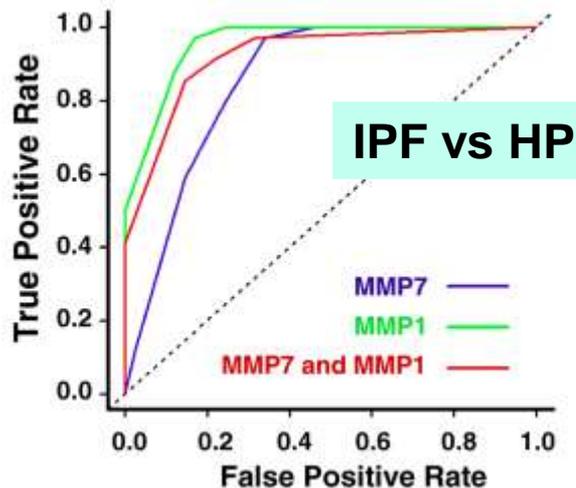

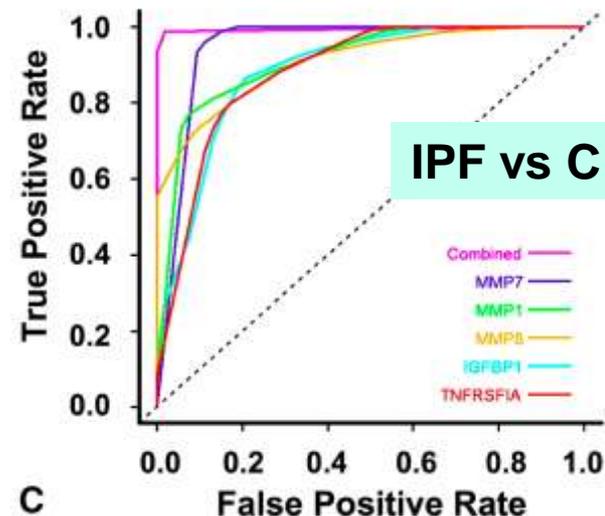

Multiplex analysis

48 proteins :
cytokines, chemokines, MMPs, GFs

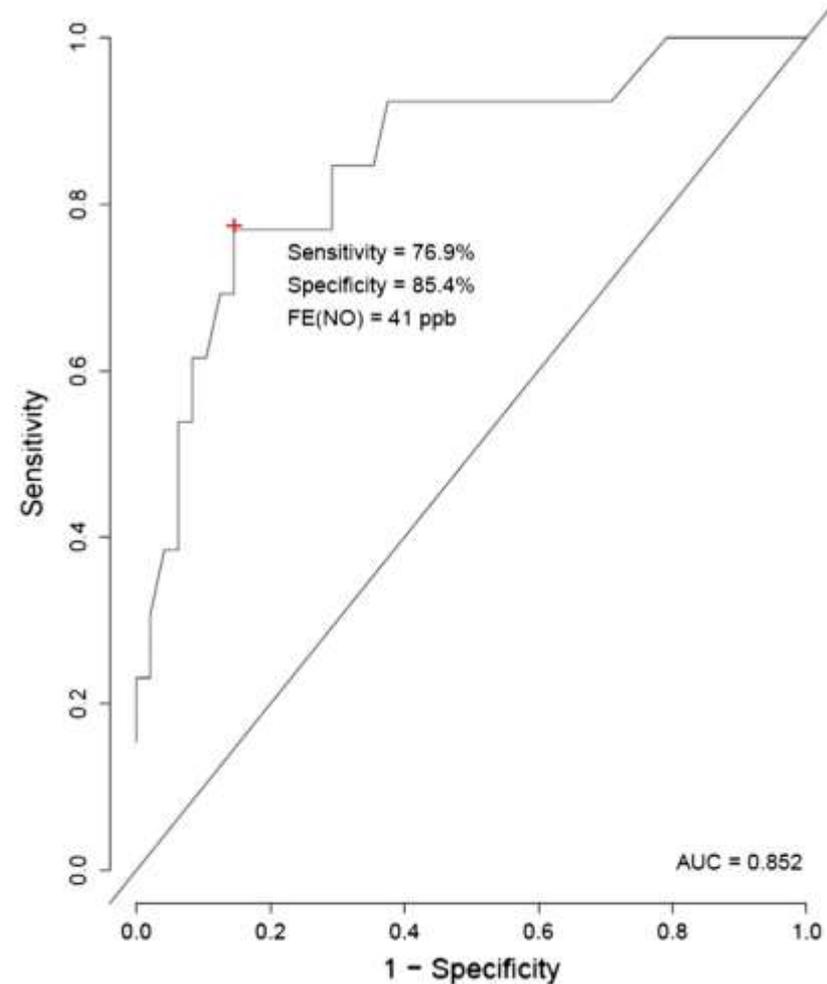

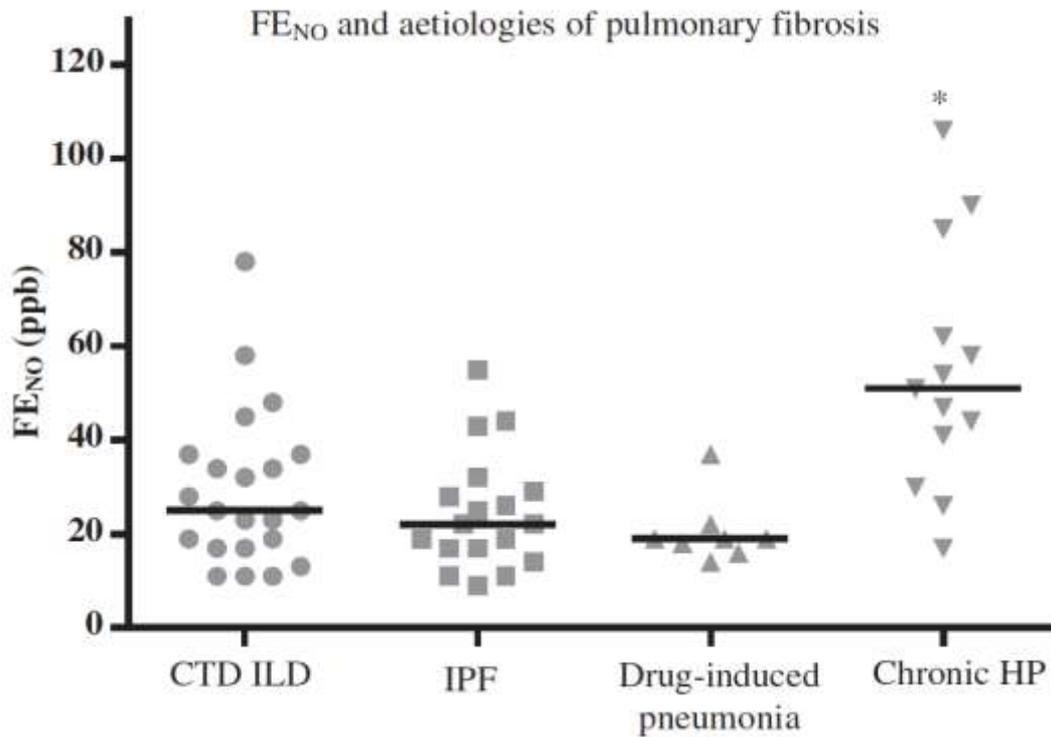

MMP1 (>2.15 ng/mL) +MMP7 (>1.99 ng/mL) :

- Excludes all controls (Sp 100%)
- Not increased in COPD or sarcoidosis
- Differentiate IPF/HP (s/a, chr)
(Se 96.3%, Sp 87.2%)

Confirmed in a validation cohort

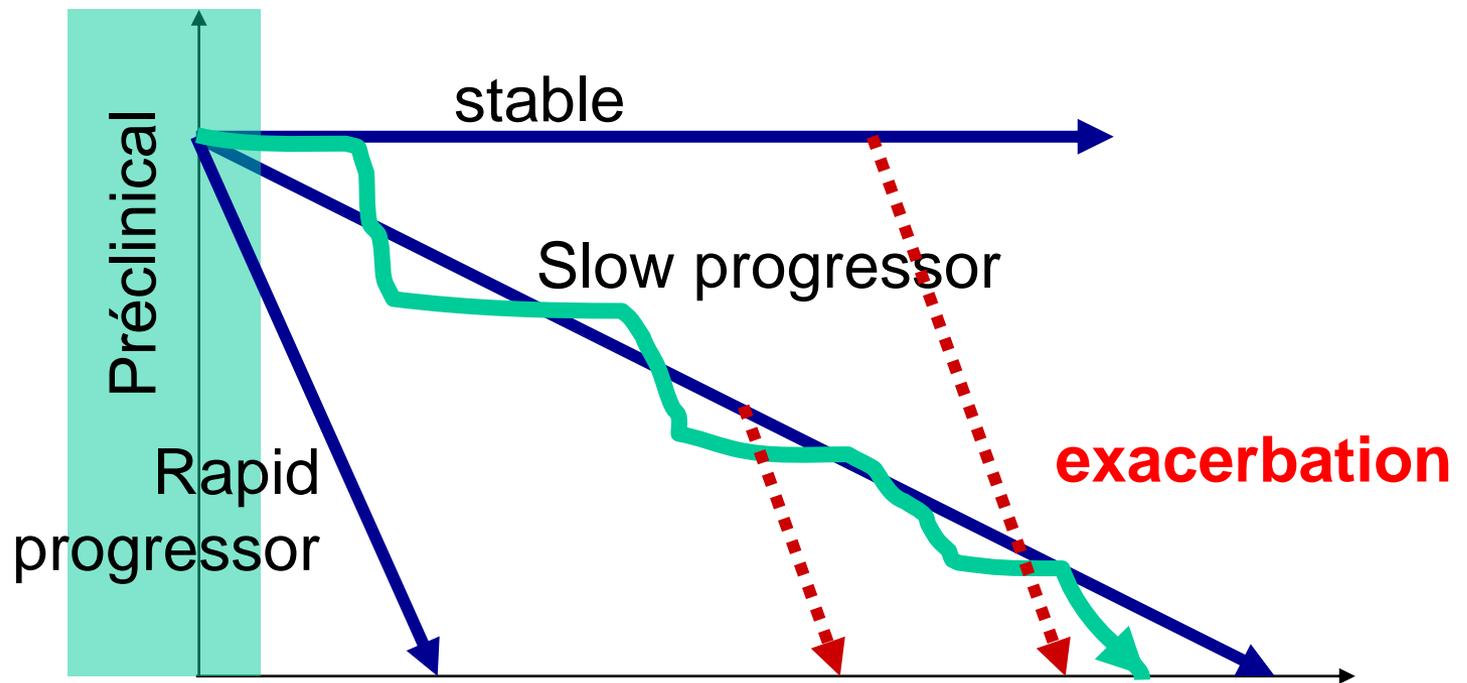

FENO for the diagnosis of chronic HP

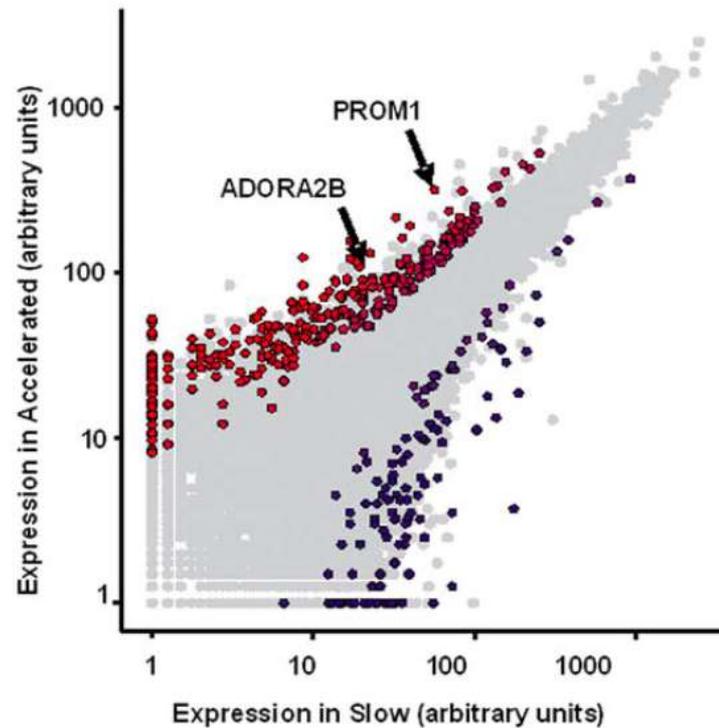

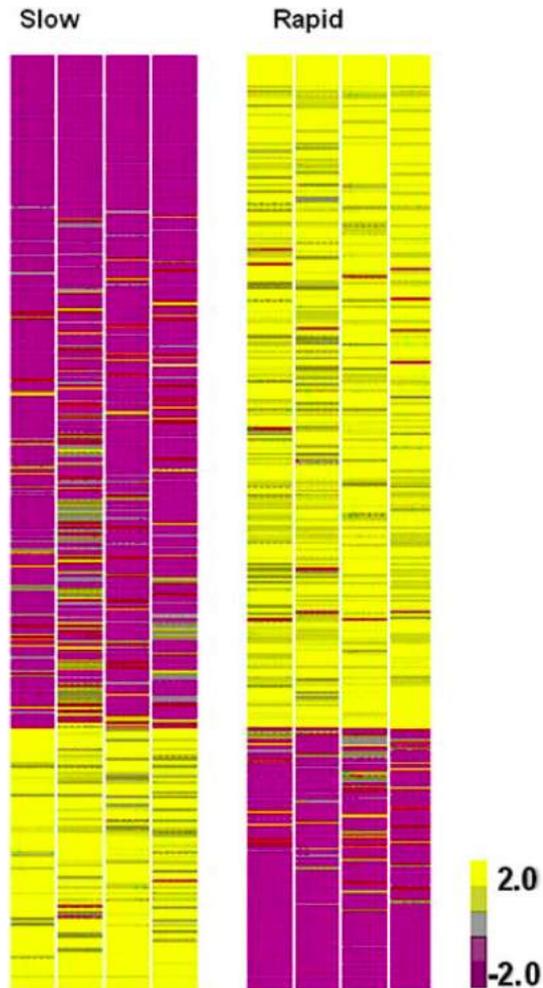

(Guilleminault...Marchand-Adam, Respir Med 2013)

Are Biomarkers of interest in ILDs ?

- **Prognosis : predict disease progression**

Lung transcriptome- Slow vs rapid progressors

(Selman, PLoS ONE, 2007; Boon, PLoS ONE 2009)

Lung miRNA- Slow vs rapid progressors

miRNA

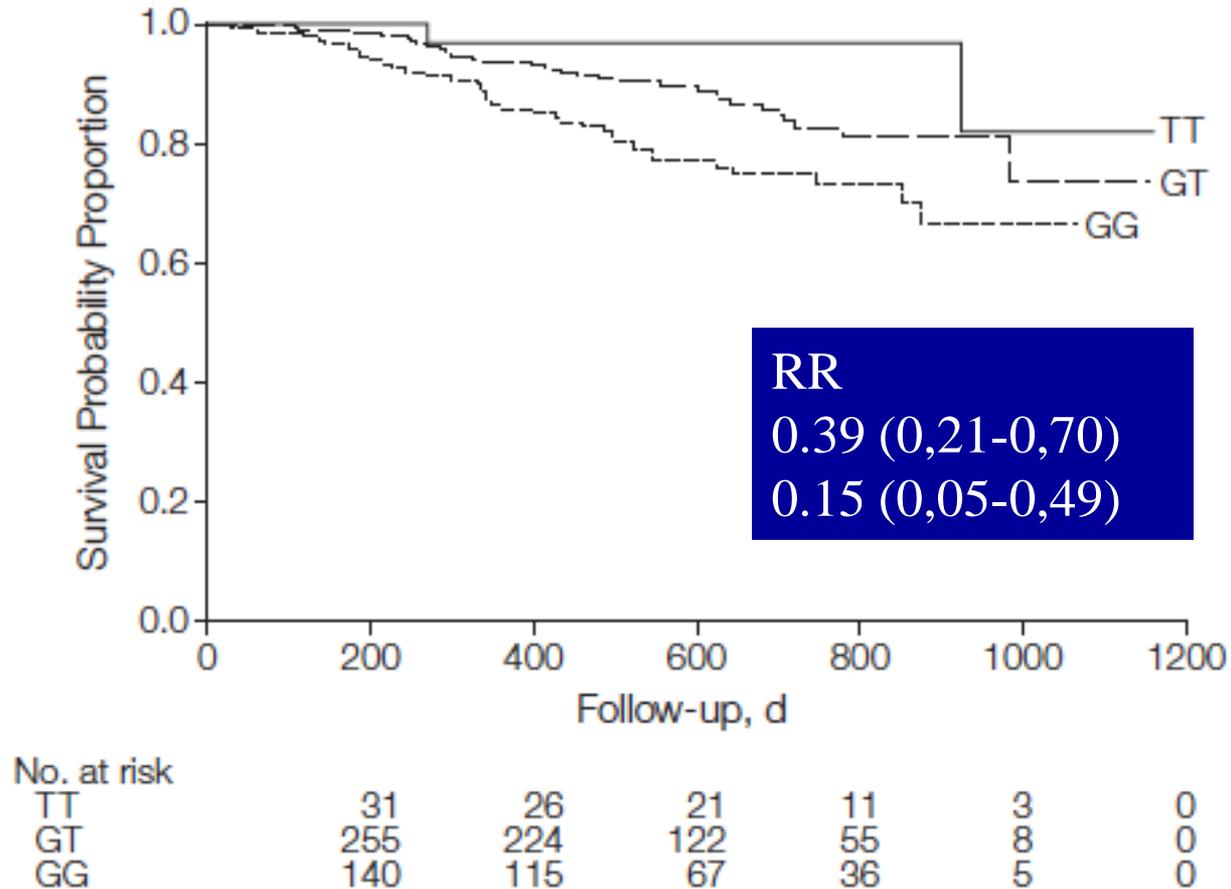

- Small non coding RNAs (21-25 nts) N≈1500
 - bind to the 3'-untranslated region of target mRNAs
- 10% are differentially expressed in IPF/Control
- A defect in lung miRNA processing in rapidly vs slowly progressing IPF
- Some miRNA control fibrogenesis
 - ↻ ↓ let-7d, miR-200, miR-31
 - ↻ ↑ miR-21

Increased (n=5) and decreased (n=1) miRNA in rapid/slow progressors

miRNA	Fold increase/decrease
miR-302c	10.56
miR-423-5p	7.97
miR-210	4.50
miR-376c	3.84
miR-185	2.94
miR-423-3p	-97.68

(Oak, PLoS ONE 2011)

Survival according to MUC5B genotype

Biomarkers for outcome in blood

KL-6 (MUC1)	IPF, Survival, Progression, Disease severity	Ohnishi, AJRCCM 2002; Ishii, Thorax 2003; Satoh, J Intern Med 2006;
SP-A, SP-D,	IPF, Survival, Progression, Disease severity	Takahashi, AJRCCM 2000; Ohnishi, AJRCCM 2002; Greene, Eur Respir J 2002; Ishii, Thorax 2003; Kinder, Chest 2009
CCL18	Survival, Progression, Disease severity	Prasse, AJRCCM 2009
YKL-40	Survival	Furuhashi, Respir Med 2010; Korhagen, Respir Med 2011
Periostin	Progression	Okamoto, Eur Respir J 2011
VEGF	Progression, Disease severity	Ando, Lung 2010
Free DNA	IPF	Casoni, Int J Biol Markers 2011
% fibrocytes	Survival	Moeller, AJRCCM 2009
%CD4(+) CD28null	Survival	Gilani, PLoS ONE 2010

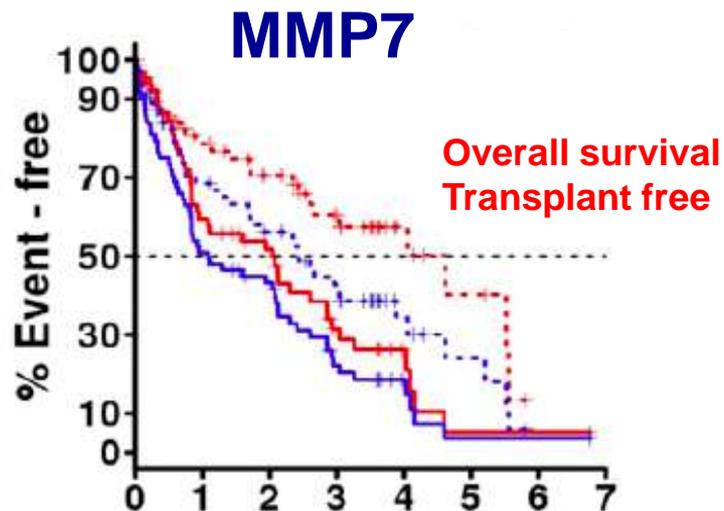

Plasma

Multiplex analysis

95 proteins

*Cytokines, chemokines, MMPs,
markers of apoptosis
and epithelial injury*

Derivation cohort : N=140 IPF

↑ MMP7, ICAM-1, VCAM-1, IL-8, S100A12
→ ↓ survival, transplant free survival,
progression free survival

(Independent of age, gender, LFTs)

Validation cohort : N=101 IPF

- All 5 five proteins : transplant free survival
- MMP7, ICAM-1, IL-8 : overall survival
- ICAM-1 : progression free survival

Plasma

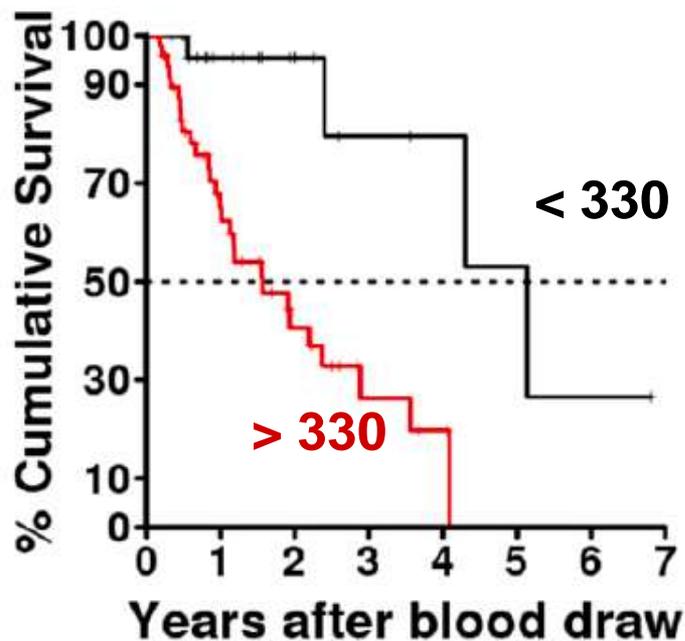

Personal Clinical and mortality Index (PCMI):

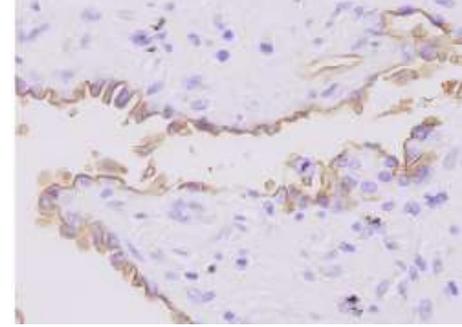

Gender
FVC
DLCO
MMP7

→ predicts survival in the derivation and validation cohorts

Survival according to index $<$ or $>$ 330

Krebs von den lungen-6 (KL-6)-MUC1

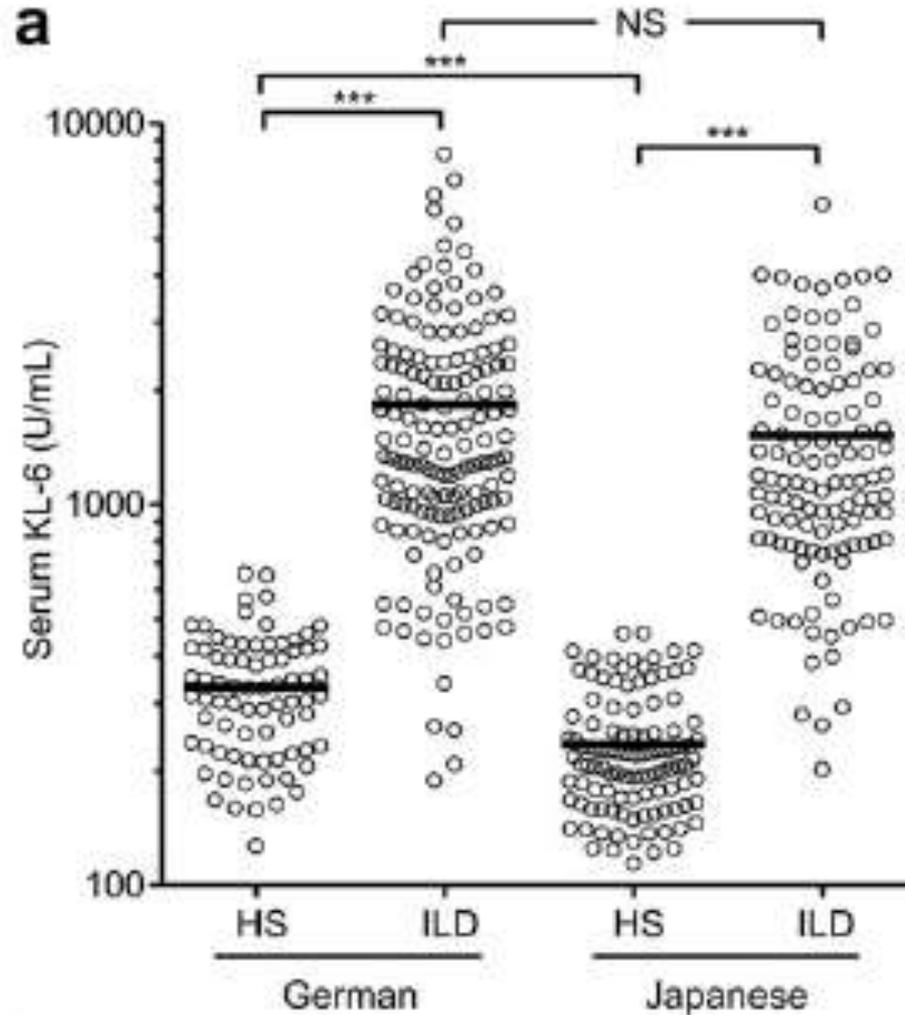

- Primary source : Regenerating type 2 pneumocytes
- Serum levels are genetically determined (common polymorphism)
- Increased in most patients with most ILDs
 - including IIPs, CVD-ILDs, HP, radiation pneumonitis, drug-induced ILDs, pulmonary sarcoidosis, and pulmonary alveolar proteinosis
- And many other diseases
 - ARDS, tuberculosis, metastatic adenocarcinomas...
- Used routinely in Japan for disease monitoring
 - > 2.000.000 assays/year in Japan

(Ishikawa, Respir Invest 2012; Horimasu... Costabel, Respir Med 2012)

Krebs von den Lungen-6 (KL-6)-MUC1

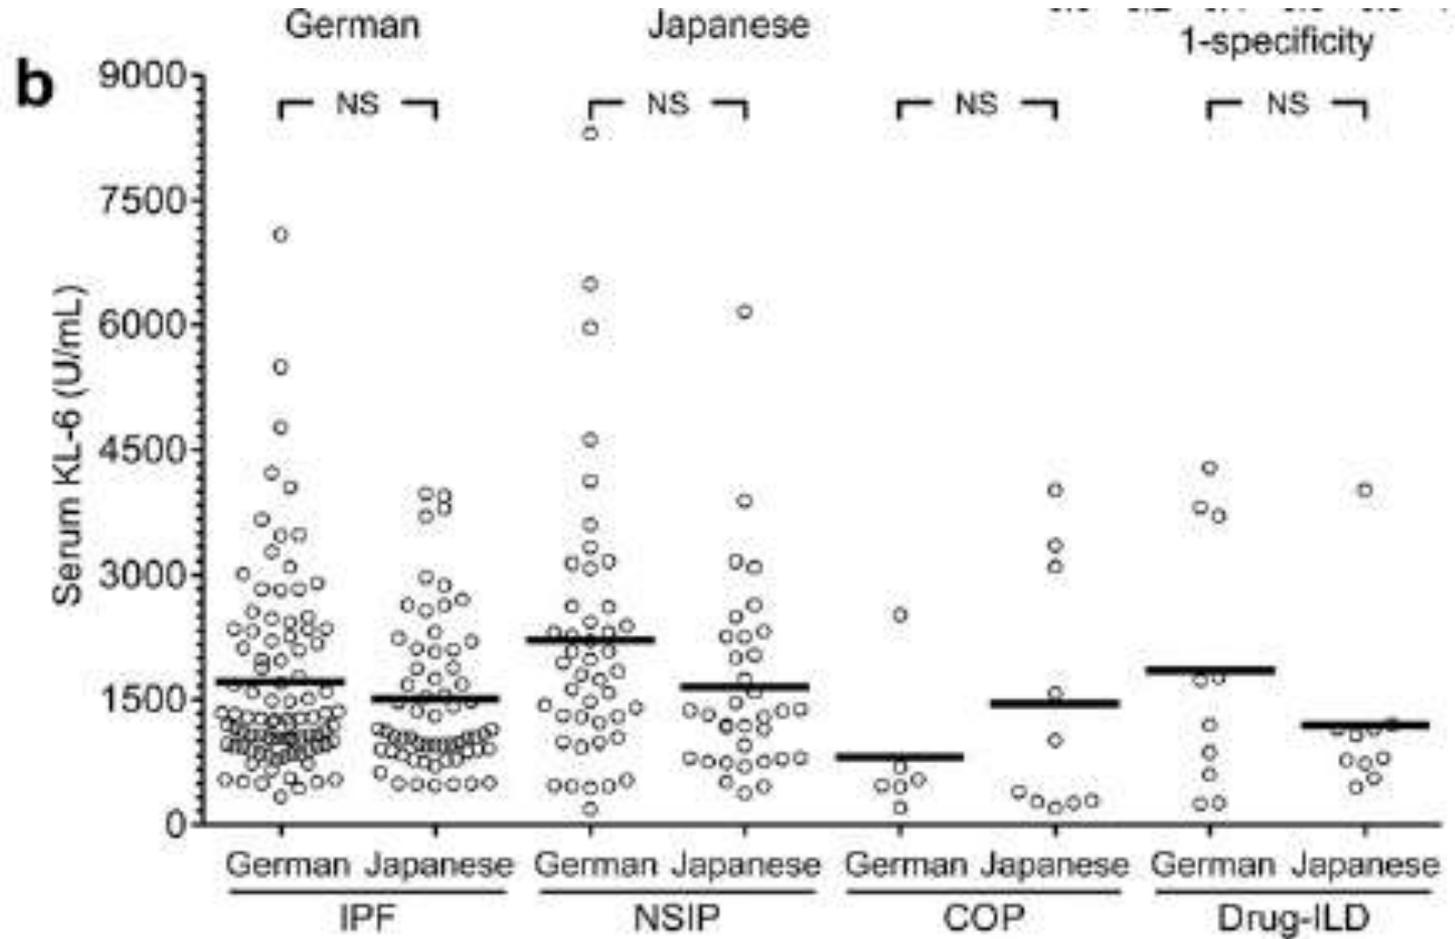

Differentiates
healthy/disea
sed

(Horimasu... Costabel, Respir Med 2012)

Krebs von den Lungen-6 (KL-6)-MUC1

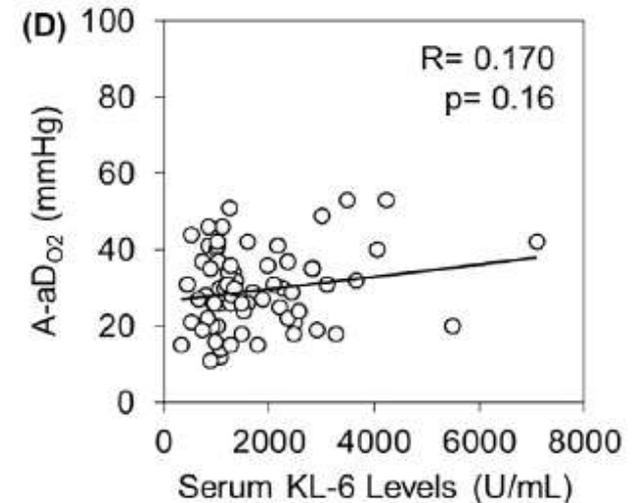

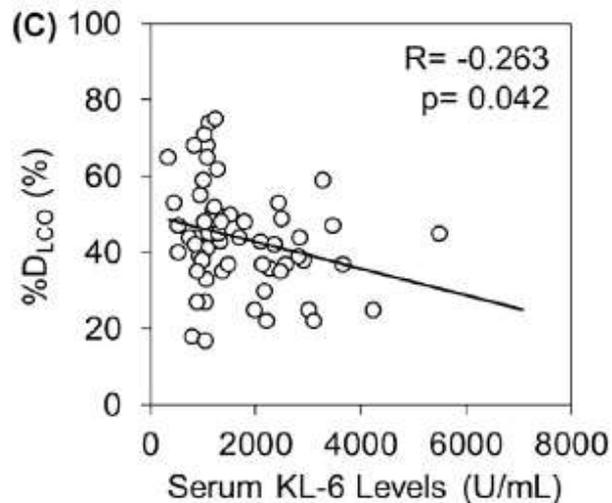

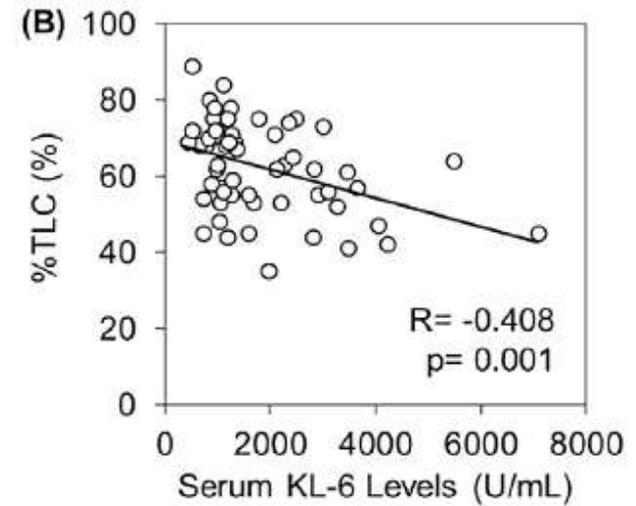

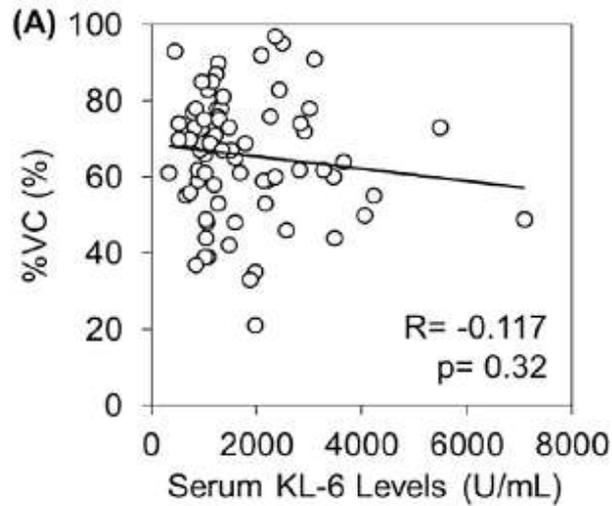

BUT
Not useful
for differential
diagnosis

(Horimasu... Costabel, Respir Med 2012)

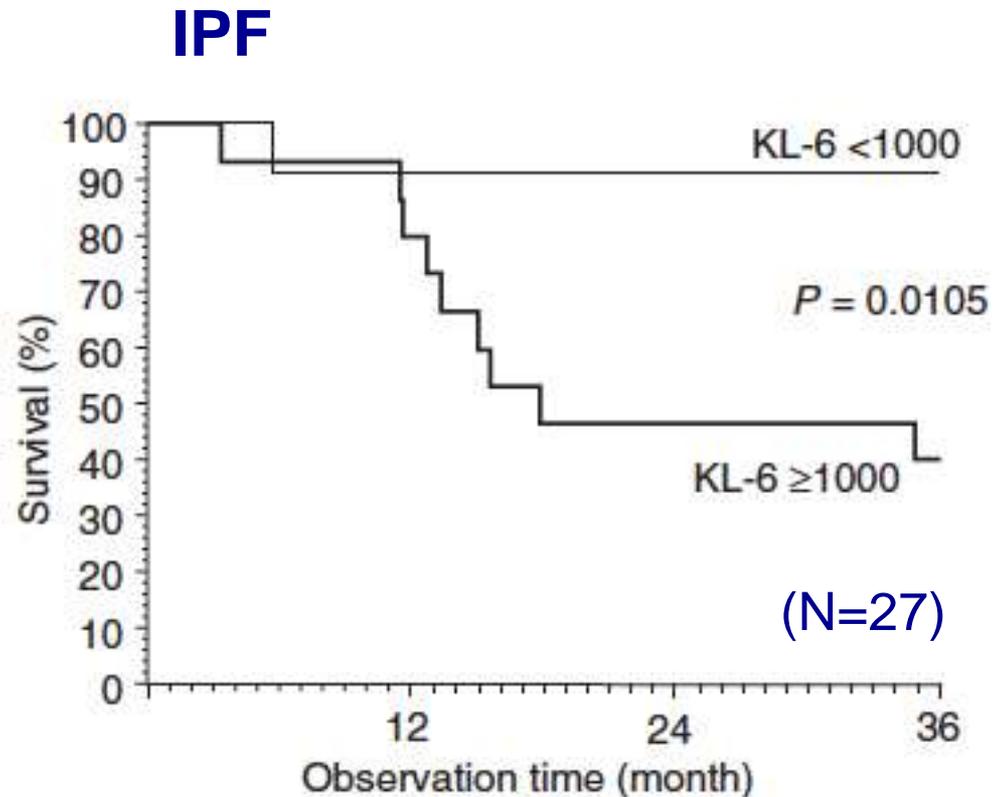

Krebs von den lungen-6 (KL-6)-MUC1

Limited correlation
with lung function

Krebs von den lungen-6 (KL-6)-MUC1

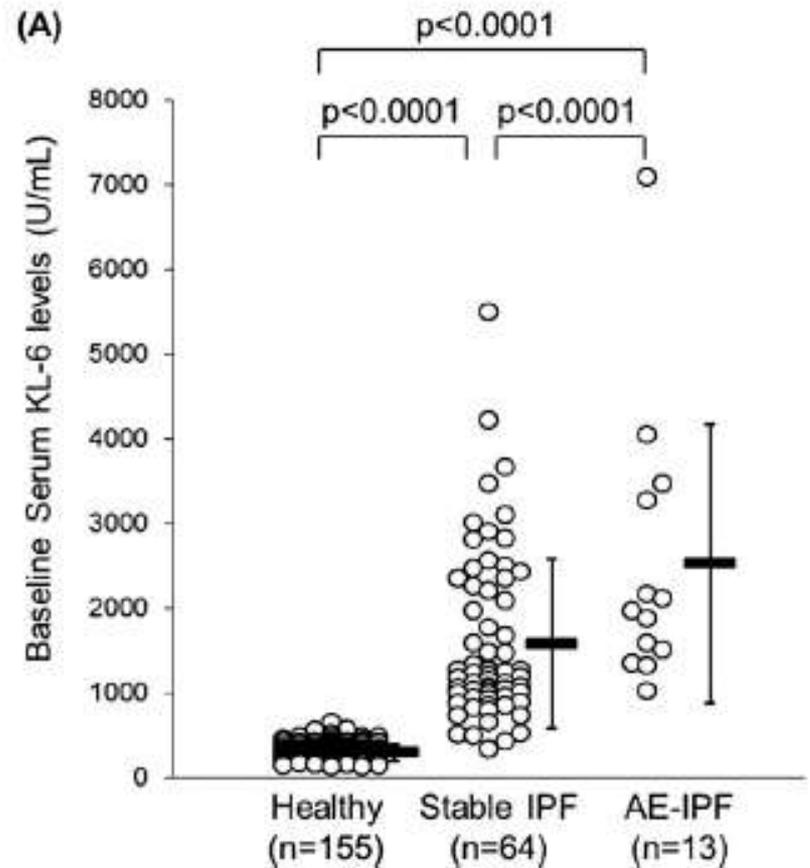

- Serum levels vary with disease changes
- The highest KL-6, the lowest the survival
- Predicts survival independently of usual variables for severity in small series (VC, DLCO)

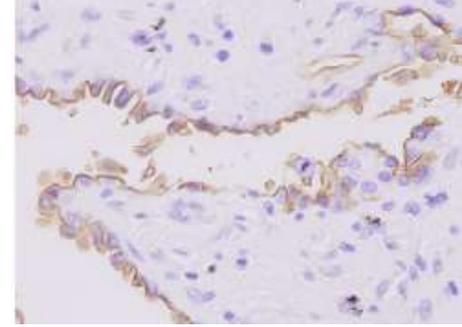

(Yokoyama, *Respirology* 2006)

Krebs von den lungen-6 (KL-6)-MUC1

- Higher levels in patients with exacerbations

Krebs von den Lungen-6 (KL-6)-MUC1

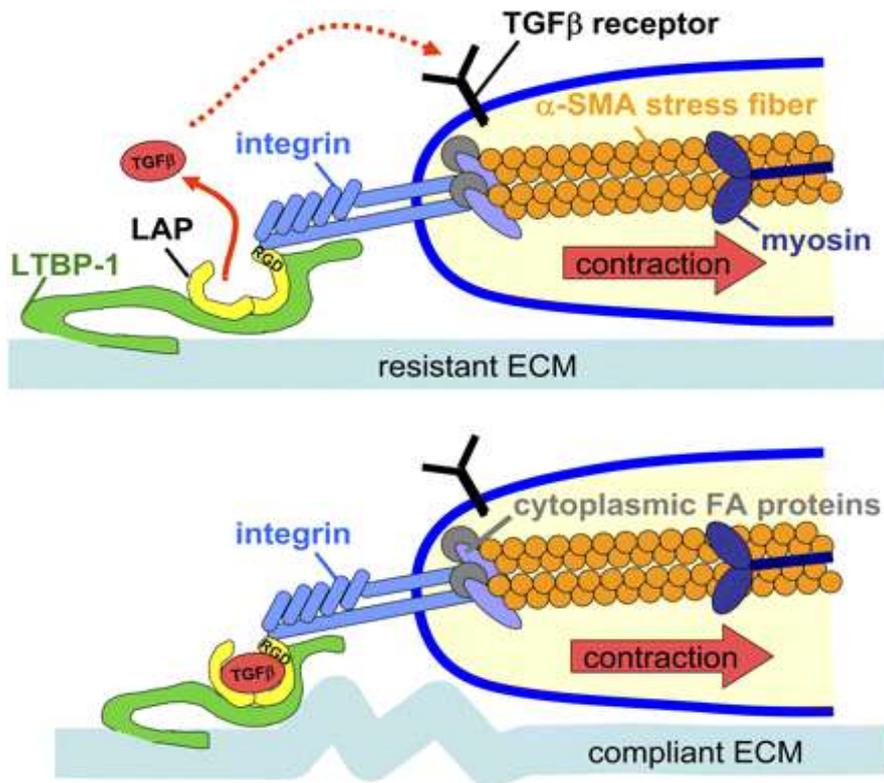

- Yet to demonstrate that it is useful for management of patients with ILDs, including IPF
- Not accepted as a clinical test in my institution

Are Biomarkers of interest in ILDs ?

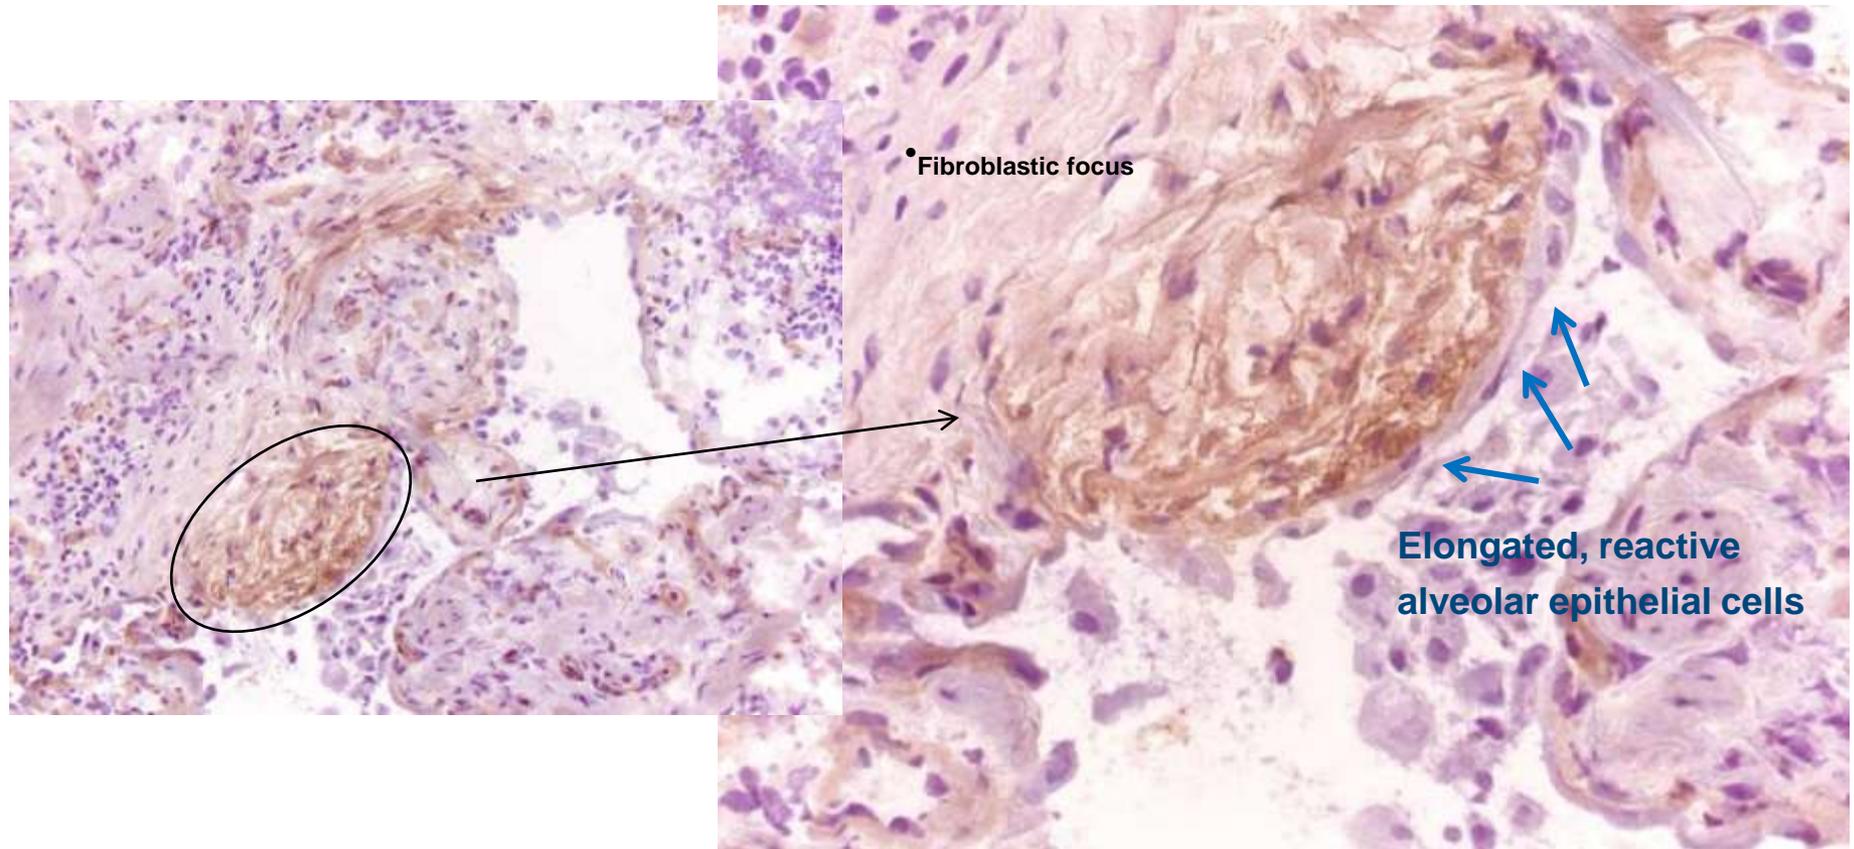

- **Treatment tailoring**
 - Identify treatment responders
 - pirfenidone, nintedanib
 - Short term read-outs for proof of concept studies
 - Disease stratification for tailored targeted therapies

Matrix stiffness modulates the phenotype of fibroblasts

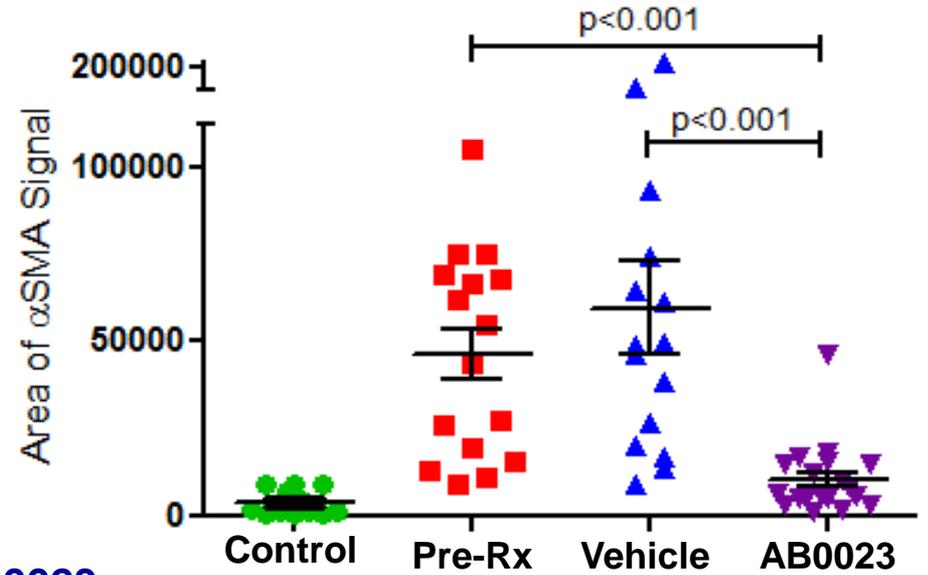

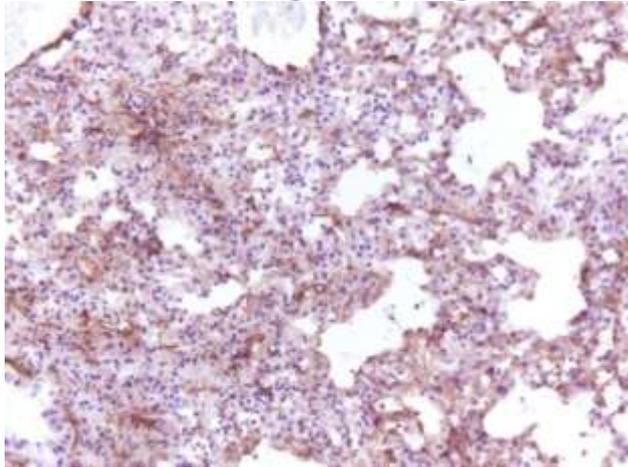

- Cross-linking enzymes modulate ECM stiffness
- Cross-linking enzymes inhibition reduces fibrosis *in vivo* :
 - Lysyl oxidase-like 2 (LOXL2)
 - Barry-Hamilton, Nat Med 2010
 - Transglutaminase 2
 - Olsen, AJRCCM 2011;
 - Oh J Exp Med 2011

LOXL2 in Lung Biopsies from IPF Patients

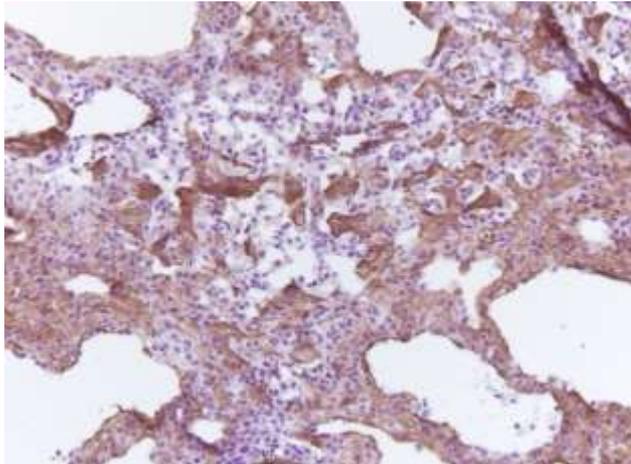

LOXL2 antibody (AB0023) inhibits bleomycin-induced Pulmonary Fibrosis

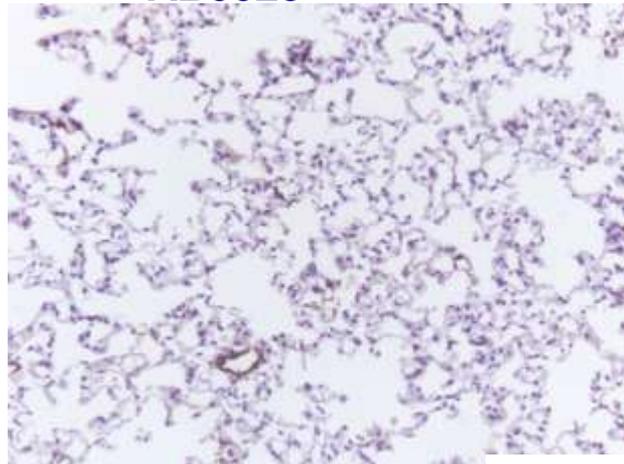

Damaged Lung

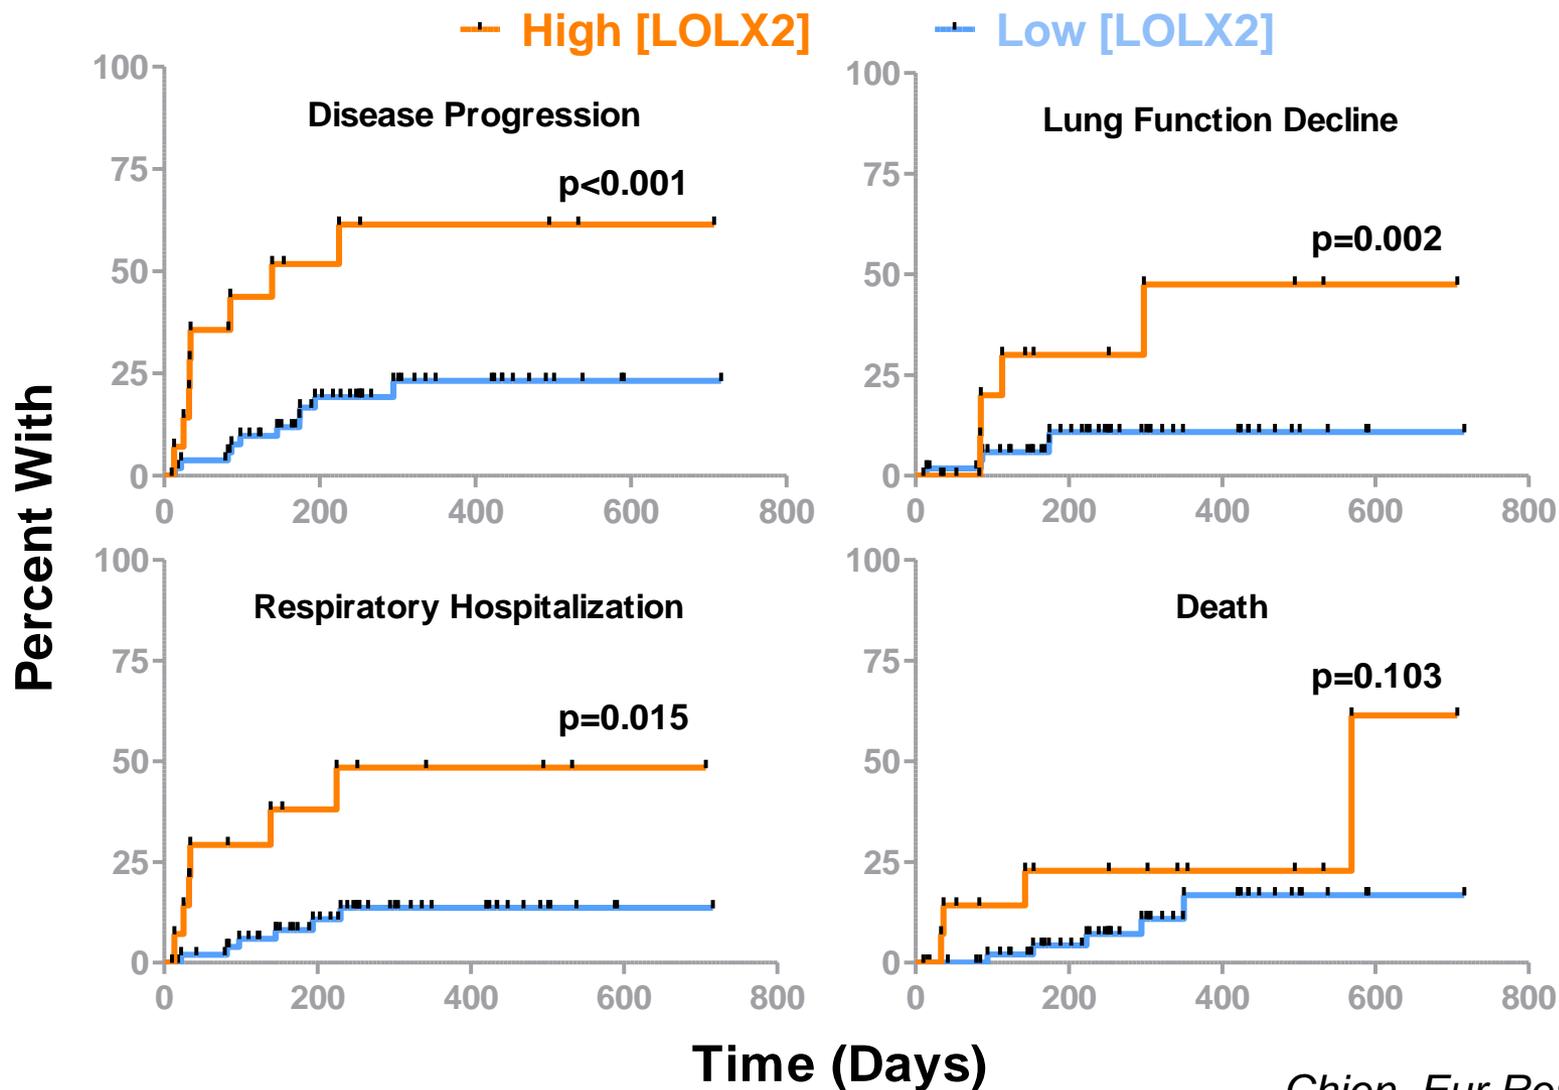

Vehicle

AB0023

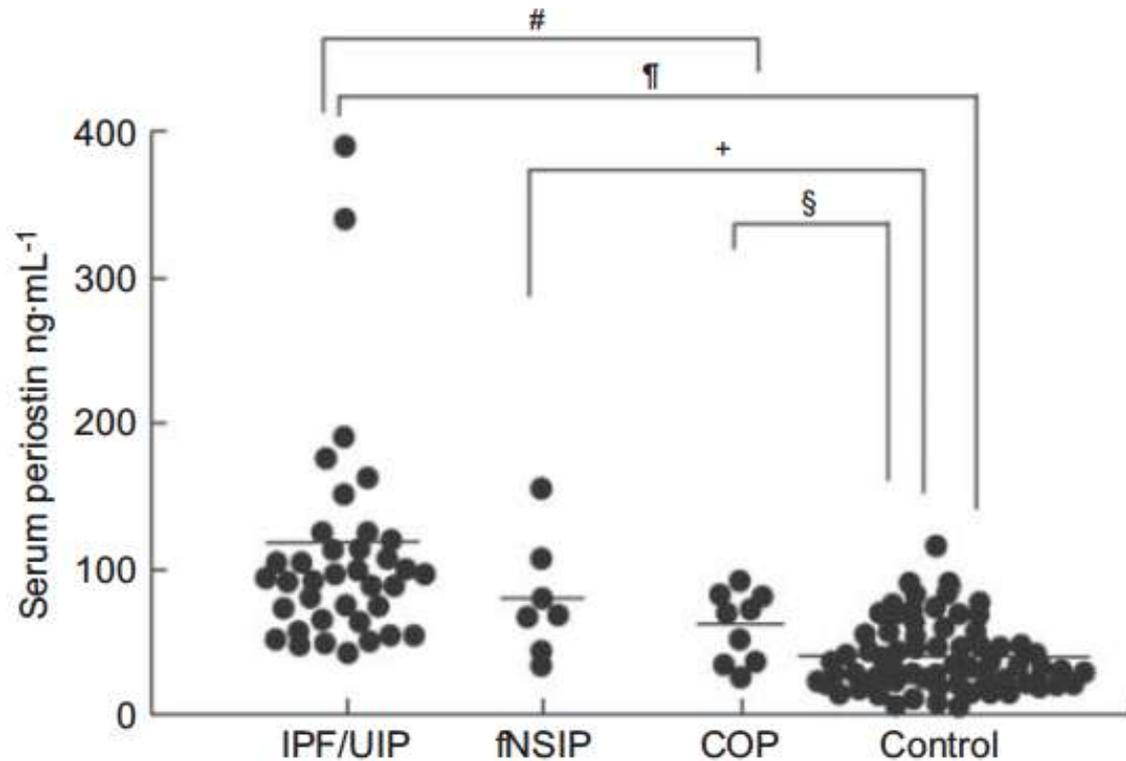

High LOXL2 (>800 pg/ml) is Associated with Significantly More Disease Progression Events

- **Anti-LOXL2 antibody currently evaluated in a phase 2/3 trial (RAINIER)**

Periostin : a marker of IL-13 activation

Periostin

- Increased in IPF patients
- Higher levels associate with lung function decline

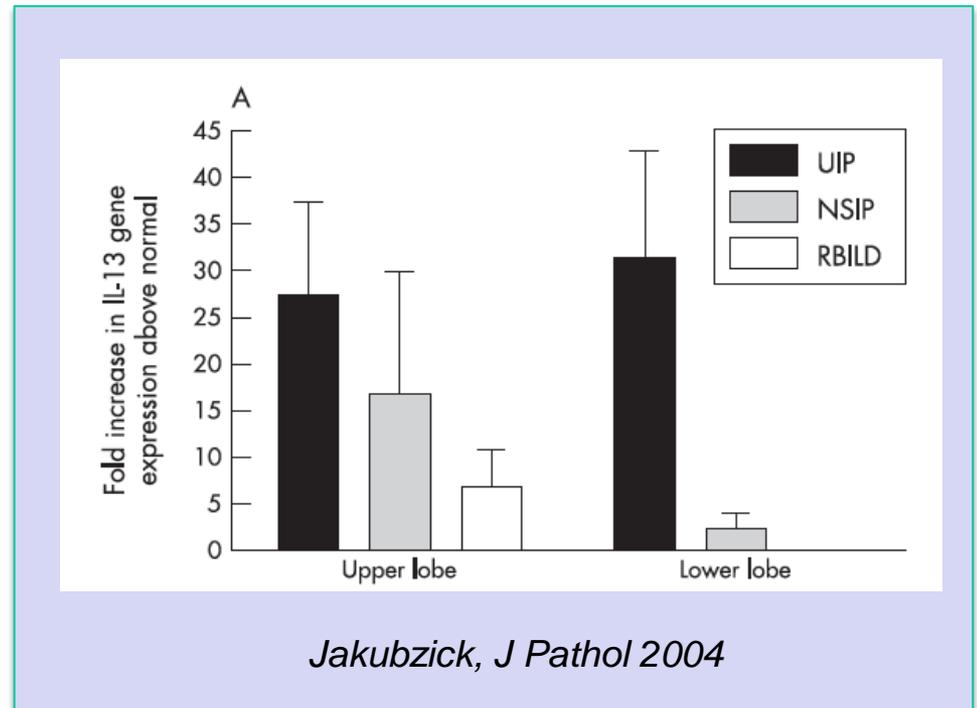

Okamoto, Eur Respir J 2011

Naik, Am J Physiol Lung 2012

Okamoto, Eur Respir J 2011

An IL-4/IL-13 profibrotic pathway in IPF

- Th2 immune response in the fibrotic lung
- Increased IL-13 production by AMs in IPF
- Increased expression of IL-4R and IL-13R in IIPs
- IL-13 overexpression in mice induces fibrosis
- IL-13 inhibition reduces Bleo-induced lung fibrosis in mice
- IL-4 and IL-13 target lung fibroblasts

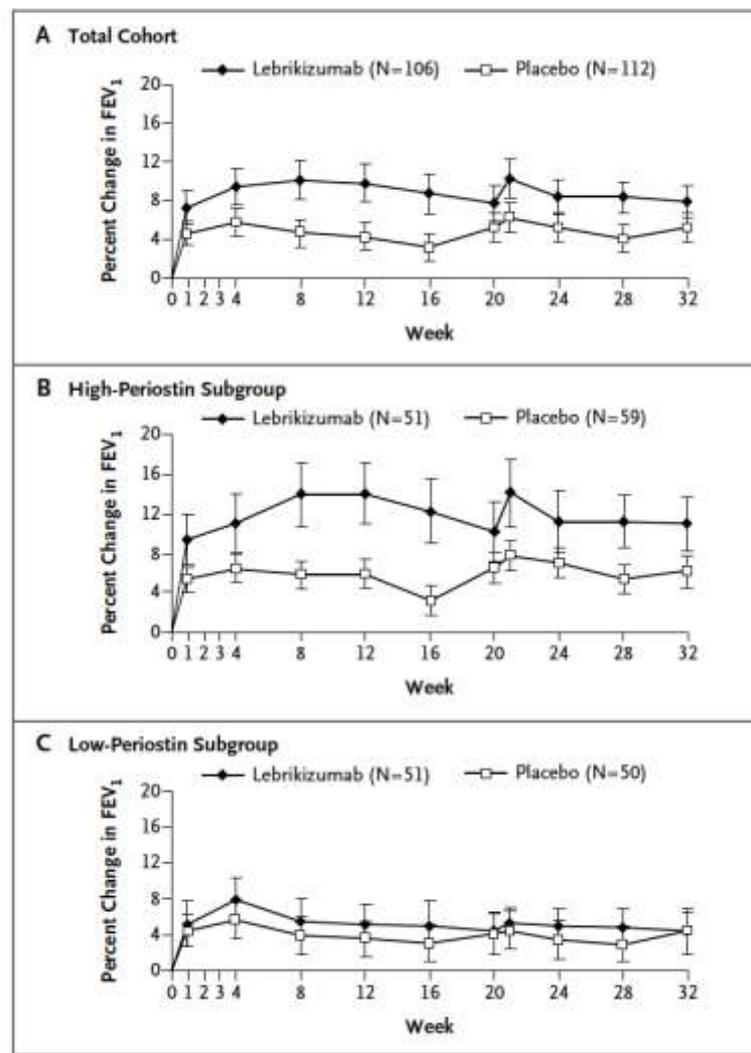

An IL-4/IL-13 profibrotic pathway in IPF

Targeting the IL-4/IL-13 pathway improves lung function in asthma in “high periostin subgroup”

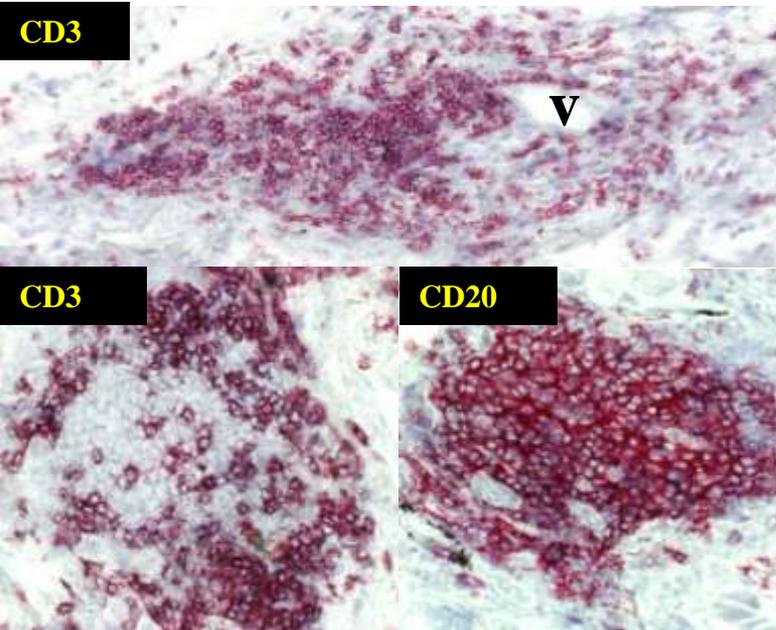

? In IPF ?

Ongoing clinical trials

Evidence for B cell activation in IPF

Marchal-Somme J, *J Immunol*, 2006

Blood

- Anti-periplakin ¹
- Anti-HSP70 ²
- CXCL13 ³

**Targeting B cells
in ILDs :**
e.g. AE-IPF, HP,
CTD-ILD

Keir, Eur Respir J 2012; Keir Respirology 2014;
NCT01524068 (Univ. Pittsburgh)

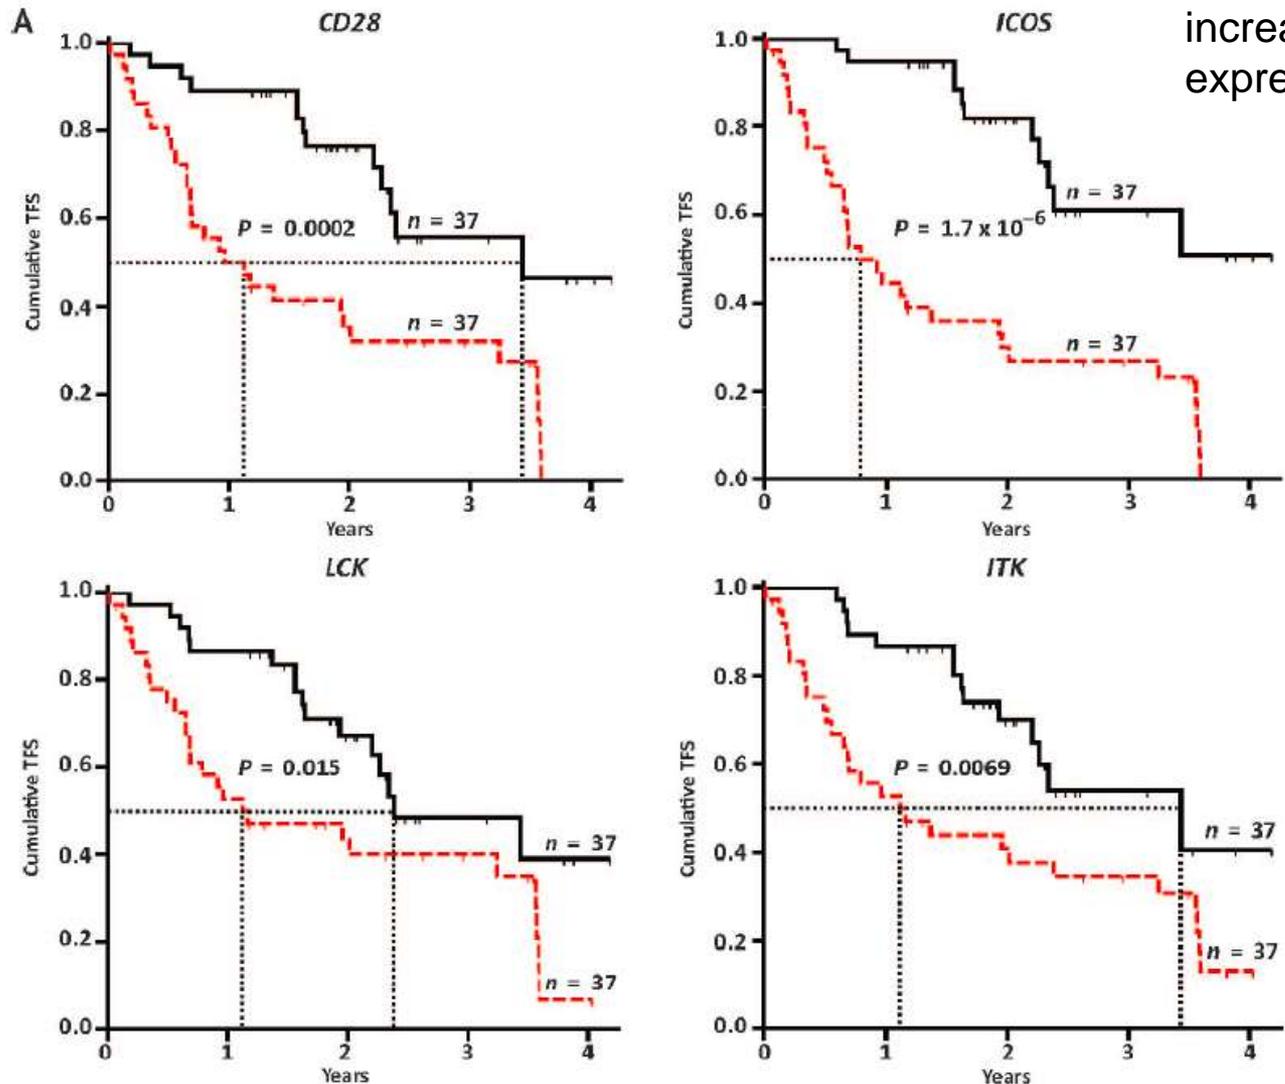

Down regulation of CD28 on circulating CD4 cells

a result of repeated antigen-driven proliferation

Blood mononuclear cells predict prognosis

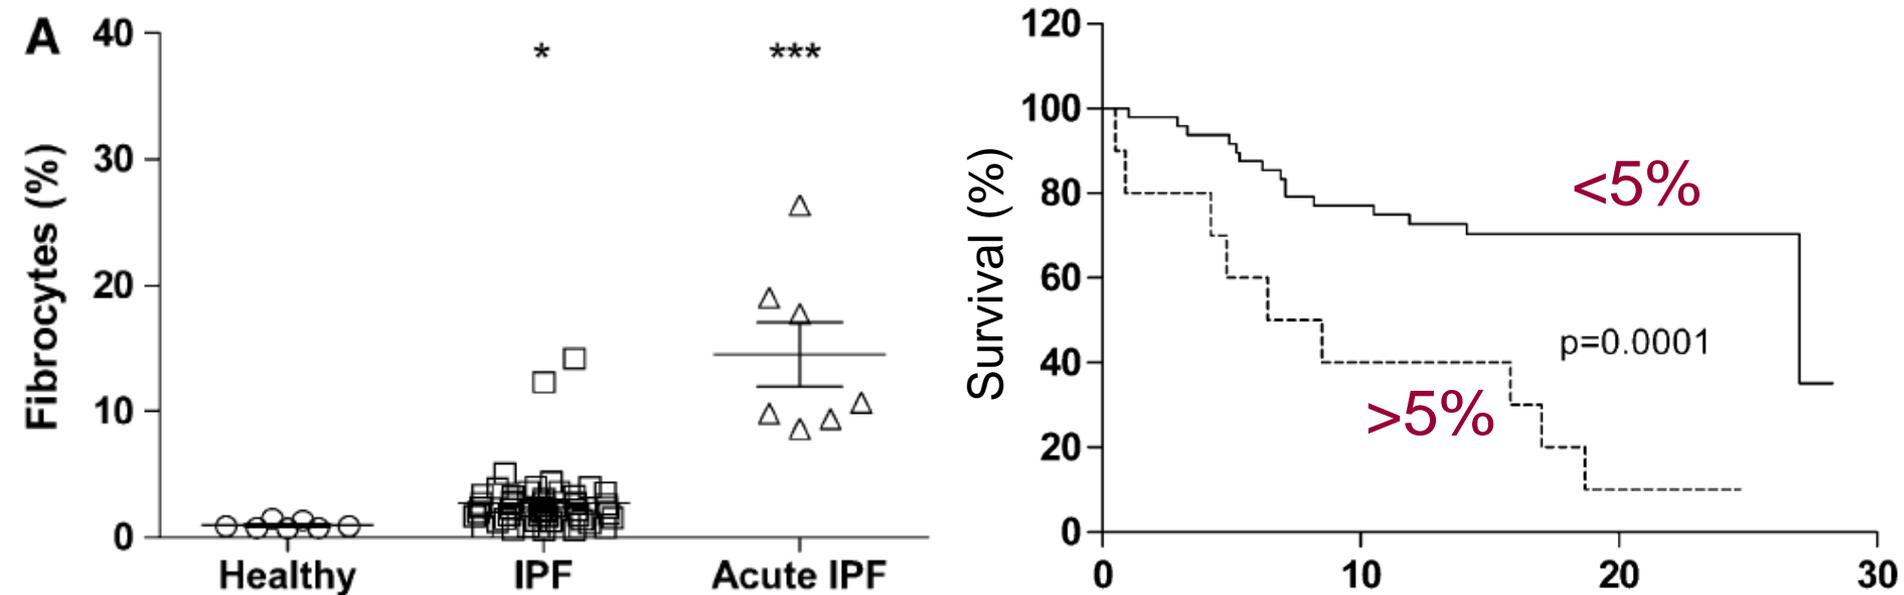

Black line :
increased
expression

Underexpression
of CD28, ICOS,
LCK and ITK,
associates with
decreased
transplant free
survival

(Herazo-Maya, *Sci Translat Med* 2013)

Blood Fibrocytes in IPF

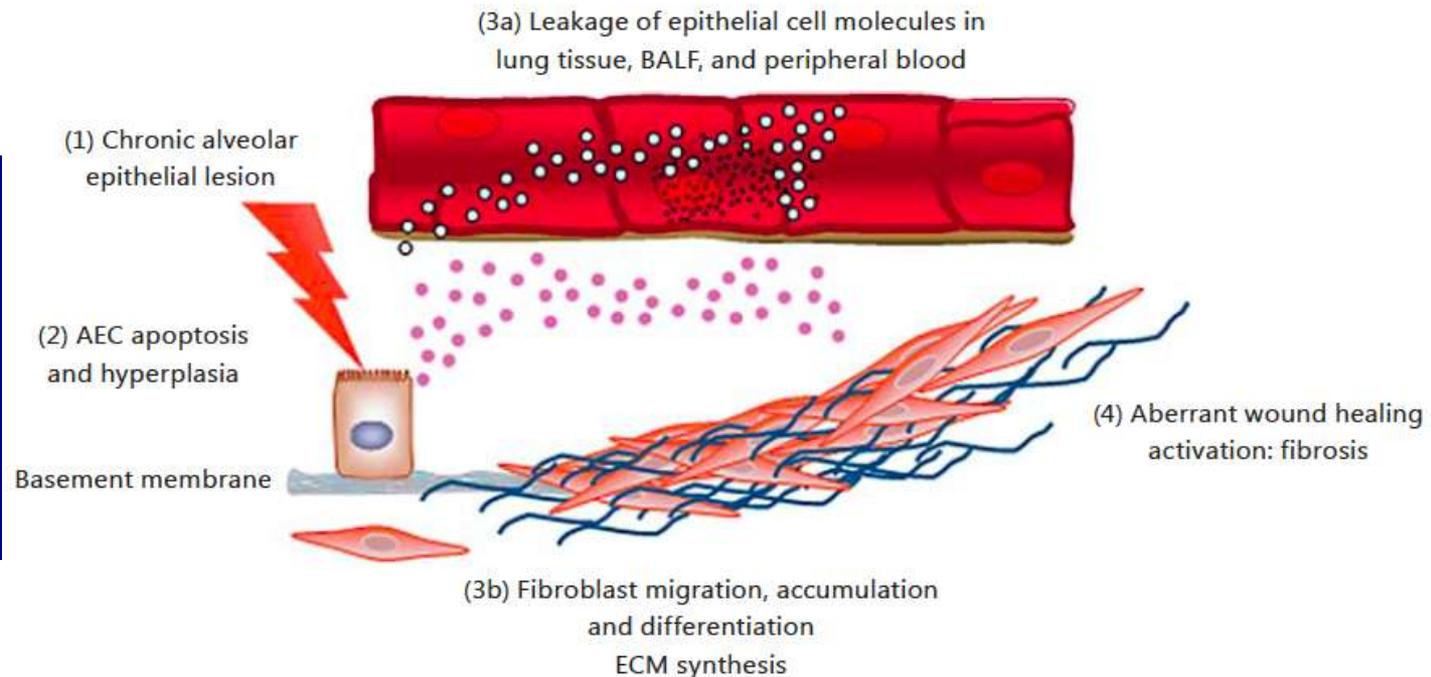

- Fibrocyte % did not correlate with LFTs or HRCT fibrosis score
- Predictive value to be determined in larger prospective studies

(Moeller, AJRCCM 2009)

Are Biomarkers of interest in ILDs ?

- A better understanding of pathophysiology

KL-6 (MUC1)
SP-A
SP-D
CA15-3
CEA

Conclusion

The search for the Holy Graal still running

- Even more needed than before
(Responders to effective antifibrotic drugs)
- Failed because of methodological reasons
 - Small retrospective cohorts
 - Mixed populations
 - Without independent validation
 - Inadequate statistics
- Take advantage of “Big cohorts” / modern validation methods/multicentric studies
